

CROCODILE CR

Hybrid Oilseed Rape

Clubroot
Resistance

45
DAYS
Superior Primary
Response

Suitable for
Min-Till or No-Till

Status: AHDB Recommended List 2026/27

Not only has CROCODILE CR closed the gap between clubroot-resistant varieties and 'normal' varieties, but in many cases it is actually out-yielding them! As clubroot infection rates appear to indicate that the disease is continuing to spread south, CROCODILE CR offers growers a valuable, high-yielding option as part of their crop rotation on land where common strains of clubroot are known to be an issue.

CROCODILE CR is recommended for use on clubroot-infected land. It is a strong-yielding variety on the AHDB List (Gross Output E/W – 95% and Seed Yield E/W – 95%), which also scores well for oil content (45.5%). It has a strong score for Light Leaf Spot (6) and good standing power. The phoma on CROCODILE CR may require attention with a score of 4.

At DSV we always aim to deliver yield with traits rather than traits at the expense of yield. Clubroot has become more apparent on farms during the last five years, with closer rotations, meaning it is often costly and hard to control.

Alongside clubroot-resistant varieties, it is also important to consider other factors, such as the PH of the soil, which should be pH 7 or above, and calcium can be added, lengthening rotations, and consideration can be given to the eradication of brassica weeds, such as runch and charlock, which can amplify the problem.

CROCODILE CR may, however, be infected by certain strains and infections that have been reported in some fields. Early drilling is not advised as this can put pressure on the protection. DSV recommends Clubroot tolerant varieties, such as CROCODILE CR and CROMPUTER CR should be grown in a 1 in 5 rotation to protect their resistance mechanisms any closer rotation could increase the chances of a breakdown.

It is important that growers protect the clubroot genetics by only planting the variety where clubroot is known to be an issue. Due to the rapid development of the lower branches of CROCODILE CR, DSV recommends a sowing rate of 40 – 50 seeds per m² and a PGR in spring is only required on fertile sites to ensure efficient harvestability. Its vigorous autumn growth allows it to be drilled over a broad range of dates without any issues.

Gross Output	95% (UK) 96% (E/W) 89% (N)
Seed Yield	95% (UK) 96% (E/W) 89% (N)
Oil Content	45.5%
Winter Hardiness	High
Autumn Vigour	High
Spring Vigour	Medium
Plant Height	151cm
Flowering	7
Maturity	6
Lodging	8
Stem Stiffness	8
Light Leaf Spot	6
Stem Canker	4
