

ARLINGTON

Master Baker

Innovation for
your growth

Parentage: Marston x Skyfall

- ✓ New high-quality milling wheat
- ✓ Wide sowing window
- ✓ PCH1 and OWBM Resistance
- ✓ Highest Septoria score of the Group 1 varieties

ARLINGTON is DSV's latest addition to its high-quality milling wheat portfolio. It has demonstrated excellent performance in Recommended List trials and has received positive feedback from both millers and bakers.

ARLINGTON is a variety that perfectly balances strong yield, top-tier baking performance and excellent agronomic traits. With a UK treated yield of 99% of controls, ARLINGTON is just 1% behind the current Group 1 leader, and is the highest-yielding Group 1 variety in the East region.

UNTREATED 94%

GROUP 1 UNTREATED YIELD UK PERFORMANCE COMPARISON

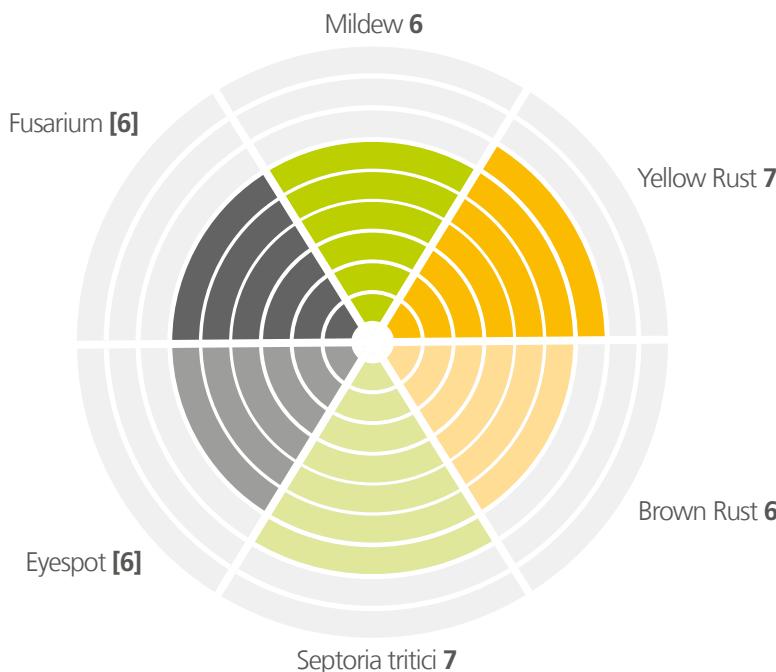

ARLINGTON offers a higher yield than KWS Vibe, SY Cheer, Skyfall and Crusoe. It is the highest yielding variety in the second cereals spot and the second highest in the first cereal situation.

AGRONOMIC FEATURES

In trials, ARLINGTON has exhibited a very clean appearance and combines a **rare mix of Pch1 eyespot resistance and Sm1 resistance to orange blossom midge** (only two varieties in the group have these characteristics), making it a top selection for growers.

ARLINGTON has the **highest septoria** of the Group 1 varieties and a high score for yellow rust with a 7. It has a good score for Mildew. Overall, DSV feels ARLINGTON offers the best disease package for farmers looking to grow a Group 1, coupled with the highest untreated yield in the group.

ARLINGTON has seen **little to no lodging** in trials since it has been introduced.

GRAIN QUALITY

Protein content (%) all trials	12.5
Hagberg Falling Number	309
Specific Weight (kg/hl)	78.9

ROTATIONAL POSITION

ARLINGTON offers a very wide sowing window to growers with its short, stiff stem offering early drilling potential as well as having a low vernalisation requirement, which allows the variety to be drilled into late February / early March. The data that DSV has been collected so far indicates that ARLINGTON can outperform spring wheats when drilled later in the sowing season.

The low vernalization requirement means that ARLINGTON can be sown late into the season, providing flexibility for farmers who are unable to sow in the autumn or who need to switch to spring sowing to suit the conditions

ARLINGTON can also be grown across a wide range of soil types, ensuring consistency wherever it is grown. It is the highest-yielding Group 1 on heavy soils.

PRAISE FOR ARLINGTON

"UK flour millers have praised ARLINGTON for its strong gluten quality, high water absorption, and excellent bake performance. It delivers a good loaf volume and is agronomically very similar to Skyfall, which has long been the benchmark for Group 1 wheat. ARLINGTON has the protein levels millers require, while still offering the quality that farmers demand for a reliable and profitable crop."

Martin Koch

"Arlington looks really interesting as a Group 1 miller. It's got the standing power, with a short stiff stem and the greenness looks incredible. It's stood up really well against disease. It has Marston head - really even and green. A fantastic crop."

Tim Lamyman

"Arlington is the new Group 1 from DSV that combines good yield potential with stronger agronomics, supporting growers to reduce risk and build greater resilience into the rotation. The variety offers similar grain quality and breadmaking potential (confirmation due March 2026) but with improved disease resistance and the second-highest untreated yield on the RL (94% treated controls). Professional milling wheat growers will appreciate Arlington's wide drilling window and strong second wheat performance along with the varieties resistance to OWBM."

Peter Brundle, Hutchinsons

"Arlington delivers a good loaf volume and is agronomically very similar to Skyfall, which has long been the benchmark for Group 1 wheat."

Sarah Hawthorne, DSV

"Considering it was drilled at such a low seed rate [150kg per hectare], it's amazing how well it looks."

George Page

"Arlington has a nice short, stiff straw. It produces fantastic grain quality and protein, with a low vernalisation requirement. Arlington has the highest untreated yield in Group 1 at 94% of treated controls, which is also the second highest on the entire RL."

Dr Matthew Kerton

Flexibility around establishment is central to the appeal. The biggest one for me is the opportunity with the wider sowing window. Arlington fits quite nicely, later drilled, similar to Skyfall."

Beth Moses, ADM
